

# Serverless with CloudRun

## What

Serverless technology is the *current* (not next) big thing in cloud technology. With CloudRun you can deploy applications easily and never look into scaling, routing, backup & security on an infrastructure level.

We will show you how to do it using an example application of your choice and enable your team to migrate more applications independently.

## Use Cases

Evaluate CloudRun for your business based on a subset of your applications.

Learn about GCP's tool chain and capabilities, source code to CloudRun deployments are your way to go.

Quickly deploy a PoC in a clean and scalable way.

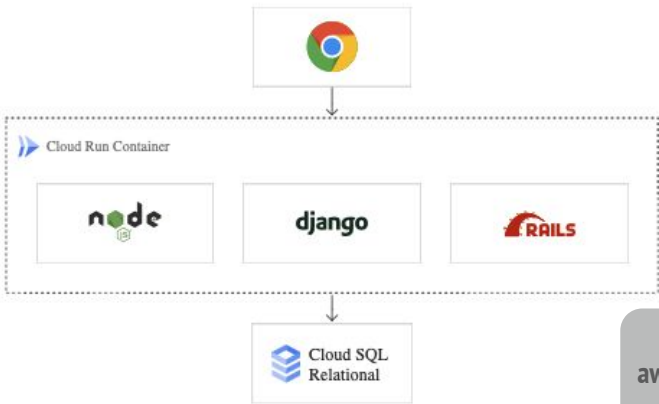

## Benefits

- Brings an application live in 5 days
- Production ready out of the box
- Experience real simplicity

## How /Architecture

All you need to do is describe your application to us, we take over deploying it.

The application needs to be stateless and packaged with docker already. That's it.
